

Calculating Total Cost of Ownership (TCO) for Your Distribution & Delivery EV Fleet

Electric vehicles (EVs) have the potential to offer fleets lower total cost of ownership (TCO) compared to diesel vehicles. While EVs require higher upfront costs to procure vehicles and install the necessary electric vehicle supply equipment (EVSE), they also provide reduced operating and fuel costs. When infrastructure and vehicles incentives, as well as LCFS credits, are factored in EVs can provide fleets steep cost-savings. A complete TCO analysis can be complex, particularly for fleets that are new to EVs. This fact sheet provides a sample TCO analysis of a diesel Class 3 delivery van versus electric, and the key factors fleets should consider when developing their own analysis.

TCO to transition a 20 vehicle fleet

Comparing a diesel vs. electric Class 3 delivery van

^{*}TCO calculation reflects the infrastructure incentives and energy savings available through PG&E's EV Fleet program

^{**}Vehicle subtotal before incentives totals \$3.86 million

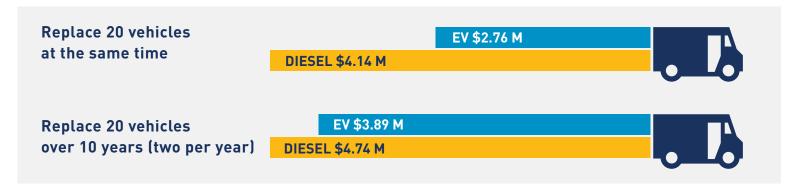

TCO assumptions

9.25% Residual value of vehicles straight LCFS credit price Insurance costs 3% line depreciation over 7 years \$120 per credit Sales tax of vehicle residual value DAYS/YEAR OPERATION YEAR AVG. VEHICLE LIFE **Fuel Type DIESEL ELECTRIC** \$50,000 \$120,000 Per Vehicle purchase cost (2020) \$0.19/kWh \$6.22/gallon Fuel cost 0.7 kWh/mile **Fuel efficiency** 12 mpg \$0.07/mile \$0.15/mile Maintenance costs \$13,750/charger* **Negligible** Infrastructure purchase costs \$1,100/charger per year Negligible Infrastructure maintenance costs \$130,000/vehicle \$0 **Purchase incentives**

Concentrate transition of vehicles to further improve TCO

While replacing vehicles gradually over time has its benefits, concentrating the transition to EVs in a shorter period of time can improve TCO. This is primarily due to the cost of site improvements to add electrical service, upgrade switchgear, and install EVSE, which do not scale linearly with the number of EVs. More specifically, it is cheaper (per unit) to install ten chargers at a site than it is to install two.

Additionally, distribution and delivery fleets currently have access to a variety of vehicle funding opportunities from agencies looking to encourage zero-emission technology now. These incentives may not be as widely available for fleets that wait to electrify.

TCO factors to consider

01

00000

Determine energy costs with our EV Fleet Savings Calculator

Fuel cost:

Typically, fleets can expect to save on fuel costs with EVs as the cost of electricity can be significantly less than traditional fuels. The time of day that you charge is often just as important as how much energy you use. PG&E can help you determine how to save with our Business EV rate plans.

02

Fuel efficiency:

EVs often use fuel more efficiently than traditional combustion engines, which could lead to fuel cost savings. Your vehicle manufacturer or dealer should be able to estimate the expected energy consumption for your duty cycles.

03

Infrastructure costs:

EVSE, which includes the EV chargers, requires improvements to the existing site's electrical infrastructure, as well as periodic maintenance and service fees. These costs must be included in a TCO analysis. **PG&E's EV Fleet program offers rebates and incentives to reduce these costs.**

Find infrastructure incentives with our EV Fleet Savings Calculator

04

Maintenance costs:

EVs can significantly reduce the cost of maintenance by eliminating common costs including oil changes, exhaust aftertreatment maintenance, spark plugs, fuel injectors, and transmission repairs. 05

Purchase incentives:

Incentives can reduce EV and EVSE costs substantially, possibly by tens of thousands of dollars per vehicle. Incentive funding is not unlimited and often subject to competition, so early adopters are more likely to benefit from these incentives.

Find funding with our summary of incentives for delivery fleets

06

Sales tax:

The higher purchase price of EVs means that sales tax is also higher than conventional vehicles. Note, the Federal Excise Tax (12% of the vehicle price) only applies to Class 7 and Class 8 trucks, and shouldn't be added to lower weight class vehicles.

07

LCFS credits:

EVs have great revenue potential under the California Low Carbon Fuel Standard Program (LCFS), which allows fleets to generate credits based on the GHG reductions they achieve using EVs. For example, a fleet with an electric delivery van can generate more than \$2,750 annually under LCFS.
